1. Introduction

some basic examples:

```
i1 : R=QQ[x,y]; factor(x^3-y^3)
```

$$o2 = (x-y)\,(x^2+x\,y+y^2)$$

```
o2 : Expression of class Product

determinant -- determinant of a matrix

Synopsis

- Usage:
  ```
  det M
  ```
- Inputs:
  ```
  -- M, a square matrix
  ```
- Optional inputs:
  ```
  -- Strategy => ..., default value null, choose between Bareiss and Cofactor
     algorithms
  ```
- Outputs:
  ```
  -- a ring element, which is the determinant of M
  ```

Description

See also

- exteriorPower -- exterior power
- minors -- ideal generated by minors
- permanents -- ideal generated by square permanents of a matrix
- pfaffians -- ideal generated by Pfaffians

Ways to use determinant :

- "determinant(Matrix)"
- "determinant(MutableMatrix)"

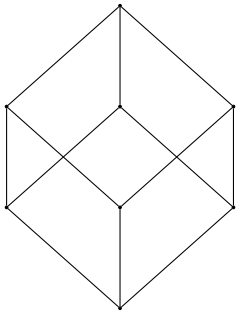
For the programmer

```
The object determinant is a method function with options.
o11 : DIV
```

3. Packages

packages that have a tex output will work:

```
i12 : needsPackage "Posets";
i13 : booleanLattice 3
```



```
o13 =
o13 : Poset
```

4. Tricky examples

```
i14 : -- some tricky examples
```

A bunch of complicated cases: a multi-line example

```
      f = i -> (
      -- that's dumb
      i+1
      )
o14 = f
o14 : FunctionClosure
```

and another weirder one:

```
i15 : I=ideal 0; f = i -> (
o15 : Ideal of ℤ
      i+1)
o16 = f
o16 : FunctionClosure
```

finally:

```
i17 : a=1;b=2;
i19 : c=3;
```

That last one has no output.
